The Waterbody Report Card tables are generated from the 2012 305(b) report on the status of N.H. waters, and are based on data collected from 2001-2011.

Designated Use	Parameter	Category	Comments
Aquatic Life	Phosphorus (Total)	Good	>=5 samples and median is < threshold but > 1/2 threshold value.
	pH	Bad	>10%, with a minimum of 2, samples exceed criteria, with 1 or more by a large margin.
	D.O. (mg/L)	Bad	>10%, with a minimum of 2, samples exceed criteria, with 1 or more by a large margin.
	D.O. (% sat)	Slightly Bad	>10% of samples exceed criteria by a small margin (minimum of 2 exceedances).
	Chlorophyll-a	Good	>=5 samples and median is < threshold but > 1/2 threshold value.
Primary Contact Recreation	E. coli	Very Good	All bacteria samples <75% of geometric mean criteria, but not enough to calculate geometric mean. Or, all bacteria samples are < single sample criteria and calculated Geometric means are less than geometric mean criteria.
	Chlorophyll-a	Very Good	At least 10 samples with 0 exceedances of criteria.

VOLUNTEER LAKE ASSESSMENT PROGRAM INDIVIDUAL LAKE REPORTS

KNOWLES POND, NORTHFIELD, NH

2012 DATA SUMMARY

OBSERVATIONS AND RECOMMENDATIONS (Refer to Table 1 and Historical Deep Spot Data Graphic)

- ♣ **CHLOROPHYLL-A:** Chlorophyll was very low and well below the NH lake median.
- ♣ **CONDUCTIVITY/CHLORIDE:** Conductivity and chloride were low and approximately equal to or below the NH lake median values.
- ♣ **E. COLI:** E. coli was very low and much less than state standards for public beaches and surface waters.
- ♣ **TOTAL PHOSPHORUS:** Epilimnetic (upper water layer) and metalimnetic (middle water layer) phosphorus levels were very low and well below the NH lake median. Hypolimnetic (lower water layer) phosphorus was slightly greater and the turbidity of the sample was elevated indicating potential bottom sediment contamination. Tributary phosphorus levels were low.
- ♣ **TRANSPARENCY:** Transparency was good and much greater than the NH lake median.
- ♣ **TURBIDITY:** Hypolimnetic turbidity was elevated possibly due to bottom sediment contamination or an increase in organic substances due to low oxygen conditions.
- ♣ **pH:** pH levels were lower than desirable and much lower in the hypolimnion due to the release of acidic by-products from decomposing organic matter.
- ♣ **RECOMMENDED ACTIONS:** Increase monitoring frequency to three times per summer (June, July, August) to better assess summer water quality averages and historical trends.
